(a) checks fixed on arrival

$$r_n = \left\lceil \frac{1}{L} \log \frac{1}{\theta w_n} \right\rceil, \qquad w_n = \frac{a_n / S_n}{2(1+u_n)^2}$$

runs computed from $a_1, \ldots, a_n$ only

$\sum_n w_n < 1$
whatever
comes next

(b) cost against dynamic range
